hgu95aACCNUM

Map Manufacturer identifiers to Accession Numbers

Description

hgu95aACCNUM is an R object that contains mappings between a manufacturer's identifiers and manufacturers accessions.

Details

For chip packages such as this, the ACCNUM mapping comes directly from the manufacturer. This is different from other mappings which are mapped onto the probes via an Entrez Gene identifier.

Each manufacturer identifier maps to a vector containing a GenBank accession number.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

```
x <- hgu95aACCNUM  
# Get the probe identifiers that are mapped to an ACCNUM mapped_probes <- mappedkeys(x)  
# Convert to a list  
xx <- as.list(x[mapped_probes])  
if(length(xx) > 0) {  
# Get the ACCNUM for the first five probes  
xx[1:5]  
# Get the first one  
xx[[1]] }
```

2 hgu95a.db

hgu95aALIAS2PROBE Map between Common Gene Symbol Identifiers and Manufacturer Identifiers

Description

hgu95aALIAS is an R object that provides mappings between common gene symbol identifiers and manufacturer identifiers.

Details

Each gene symbol is mapped to a named vector of manufacturer identifiers. The name represents the gene symbol and the vector contains all manufacturer identifiers that are found for that symbol. An NA is reported for any gene symbol that cannot be mapped to any manufacturer identifiers.

This mapping includes ALL gene symbols including those which are already listed in the SYMBOL map. The SYMBOL map is meant to only list official gene symbols, while the ALIAS maps are meant to store all used symbols.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

Examples

```
# Convert the object to a list xx <- as.list(hgu95aALIAS2PROBE) if (length(xx) > 0) {
# Get the probe identifiers for the first two aliases xx[1:2]
# Get the first one xx[[1]]
}
```

hgu95a.db

Bioconductor annotation data package

Description

Welcome to the hgu95a.db annotation Package. The purpose of this package is to provide detailed information about the hgu95a platform. This package is updated biannually.

You can learn what objects this package supports with the following command:

```
ls("package:hgu95a.db")
```

Each of these objects has their own manual page detailing where relevant data was obtained along with some examples of how to use it.

```
ls("package:hgu95a.db")
```

hgu95aCHRLENGTHS A named vector for the length of each of the chromosomes

Description

hgu95aCHRLENGTHS provides the length measured in base pairs for each of the chromosomes.

Details

This is a named vector with chromosome numbers as the names and the corresponding lengths for chromosomes as the values.

Total lengths of chromosomes were derived by calculating the number of base pairs on the sequence string for each chromosome.

Examples

```
 \begin{array}{l} tt <- \ hgu95aCHRLENGTHS \\ \# \ Length \ of \ chromosome \ 1 \\ tt["1"] \end{array}
```

hgu95aCHRLOC

Map Manufacturer IDs to Chromosomal Location

Description

hgu95aCHRLOC is an R object that maps manufacturer identifiers to the starting position of the gene. The position of a gene is measured as the number of base pairs.

The CHRLOCEND mapping is the same as the CHRLOC mapping except that it specifies the ending base of a gene instead of the start.

Details

Each manufacturer identifier maps to a named vector of chromosomal locations, where the name indicates the chromosome. Due to inconsistencies that may exist at the time the object was built, these vectors may contain more than one chromosome and/or location. If the chromosomal location is unknown, the vector will contain an NA.

Chromosomal locations on both the sense and antisense strands are measured as the number of base pairs from the p (5' end of the sense strand) to q (3' end of the sense strand) arms. Chromosomal locations on the antisense strand have a leading "-" sign (e. g. -1234567).

Since some genes have multiple start sites, this field can map to multiple locations.

Mappings were based on data provided by: UCSC Genome Bioinformatics (Homo sapiens) ftp://hgdownload.cse.ucsc.ed With a date stamp from the source of: 2010-Mar22

4 hgu95aCHR

Examples

```
x <- hgu95aCHRLOC  
# Get the probe identifiers that are mapped to chromosome locations mapped_probes <- mappedkeys(x)  
# Convert to a list  
xx <- as.list(x[mapped_probes])  
if(length(xx) > 0) {  
# Get the CHRLOC for the first five probes  
xx[1:5]  
# Get the first one  
xx[[1]] }
```

hgu95aCHR

Map Manufacturer IDs to Chromosomes

Description

hgu95aCHR is an R object that provides mappings between a manufacturer identifier and the chromosome that contains the gene of interest.

Details

Each manufacturer identifier maps to a vector of chromosomes. Due to inconsistencies that may exist at the time the object was built, the vector may contain more than one chromosome (e.g., the identifier may map to more than one chromosome). If the chromosomal location is unknown, the vector will contain an NA.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

```
x <\mbox{-} hgu95aCHR \# Get the probe identifiers that are mapped to a chromosome mapped_probes <\mathref{-} mappedkeys(x) \# Convert to a list xx <\mbox{-} as.list(x[mapped_probes]) if(length(xx) > 0) { \# Get the CHR for the first five probes xx[1:5] \# Get the first one xx[[1]] }
```

hgu95a_dbconn 5

hgu95a_dbconn Collect information about the package annotation DB	n DB
-------------------------------------------------------------------	------

Description

Some convenience functions for getting a connection object to (or collecting information about) the package annotation DB.

Usage

```
hgu95a_dbconn()
hgu95a_dbfile()
hgu95a_dbschema(file="", show.indices=FALSE)
hgu95a_dbInfo()
```

Arguments

file A connection, or a character string naming the file to print to (see the file argu-

ment of the cat function for the details).

show.indices The CREATE INDEX statements are not shown by default. Use show.indices=TRUE

to get them.

Details

hgu95a_dbconn returns a connection object to the package annotation DB. IMPORTANT: Don't call dbDisconnect on the connection object returned by hgu95a_dbconn or you will break all the AnnDbObj objects defined in this package!

 $hgu95a_dbfile$ returns the path (character string) to the package annotation DB (this is an SQLite file).

hgu95a dbschema prints the schema definition of the package annotation DB.

hgu95a dbInfo prints other information about the package annotation DB.

Value

hgu95a_dbconn: a DBIConnection object representing an open connection to the package annotation DB.

hgu95a_dbfile: a character string with the path to the package annotation DB.

```
hgu95a_dbschema: none (invisible NULL).
hgu95a_dbInfo: none (invisible NULL).
```

## The connection object returned by hgu95a_dbconn() was

## created with:
dbConnect(SQLite(), dbname=hgu95a_dbfile(), cache_size=64000,
synchronous=0)

hgu95a_dbschema()

hgu95a_dbInfo()
```

hgu95aENSEMBL

Map Ensembl gene accession numbers with Entrez Gene identifiers

Description

hgu95aENSEMBL is an R object that contains mappings between manufacturer identifiers and Ensembl gene accession numbers.

Details

This object is a simple mapping of manufacturer identifiers to Ensembl gene Accession Numbers.

Mappings were based on data provided by BOTH of these sources: http://www.ensembl.org/biomart/martview/ftp://ftp.ncbi.nlm.nih.gov/gene/DATA

For most species, this mapping is a combination of manufacturer to ensembl IDs from BOTH NCBI and ensembl. Users who wish to only use mappings from NCBI are encouraged to see the ncbi2ensembl table in the appropriate organism package. Users who wish to only use mappings from ensembl are encouraged to see the ensembl2ncbi table which is also found in the appropriate organism packages. These mappings are based upon the ensembl table which is contains data from BOTH of these sources in an effort to maximize the chances that you will find a match.

For worms and flies however, this mapping is based only on sources from ensembl, as these organisms do not have ensembl to entrez gene mapping data at NCBI.

```
 \begin{array}{l} x <- \ hgu95aENSEMBL \\ \# \ Get \ the \ entrez \ gene \ IDs \ that \ are \ mapped \ to \ an \ Ensembl \ ID \\ mapped\_genes <- \ mappedkeys(x) \\ \# \ Convert \ to \ a \ list \\ xx <- \ as.list(x[mapped\_genes]) \\ if(length(xx) > 0) \ \{ \\ \# \ Get \ the \ Ensembl \ gene \ IDs \ for \ the \ first \ five \ genes \\ xx[1:5] \\ \# \ Get \ the \ first \ one \\ xx[1:1] \\ \} \\ \# For \ the \ reverse \ map \ ENSEMBL2PROBE: \\ \# \ Convert \ to \ a \ list \\ xx <- \ as.list(hgu95aENSEMBL2PROBE) \\ if(length(xx) > 0) \{ \end{array}
```

hgu95aENTREZID 7

```
# Gets the entrez gene IDs for the first five Ensembl IDs xx[1:5] # Get the first one xx[[1]]
```

hgu95aENTREZID

Map between Manufacturer Identifiers and Entrez Gene

Description

hgu95aENTREZID is an R object that provides mappings between manufacturer identifiers and Entrez Gene identifiers.

Details

Each manufacturer identifier is mapped to a vector of Entrez Gene identifiers. An NA is assigned to those manufacturer identifiers that can not be mapped to an Entrez Gene identifier at this time.

If a given manufacturer identifier can be mapped to different Entrez Gene identifiers from various sources, we attempt to select the common identifiers. If a concensus cannot be determined, we select the smallest identifier.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

References

http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?db=gene

```
x <- hgu95aENTREZID  
# Get the probe identifiers that are mapped to an ENTREZ Gene ID mapped_probes <- mappedkeys(x)  
# Convert to a list  
xx <- as.list(x[mapped_probes])  
if(length(xx) > 0) {  
# Get the ENTREZID for the first five probes  
xx[1:5]  
# Get the first one  
xx[[1]] }
```

8 hgu95aENZYME

hgu95aENZYME Maps between Manufacturer IDs and Enzyme Commission (EC) Numbers	hgu95aENZYME
-------------------------------------------------------------------------------	--------------

Description

hgu95aENZYME is an R object that provides mappings between manufacturer identifiers and EC numbers. hgu95aENZYME2PROBE is an R object that maps Enzyme Commission (EC) numbers to manufacturer identifiers.

Details

When the hgu95aENZYME maping viewed as a list, each manufacturer identifier maps to a named vector containing the EC number that corresponds to the enzyme produced by that gene. The names corresponds to the manufacturer identifiers. If this information is unknown, the vector will contain an NA.

For the hgu95aENZYME2PROBE, each EC number maps to a named vector containing all of the manufacturer identifiers that correspond to the gene that produces that enzyme. The name of the vector corresponds to the EC number.

Enzyme Commission numbers are assigned by the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology http://www.chem.qmw.ac.uk/iubmb/enzyme/ to allow enzymes to be identified.

An Enzyme Commission number is of the format EC x.y.z.w, where x, y, z, and w are numeric numbers. In hgu95aENZYME2PROBE, EC is dropped from the Enzyme Commission numbers.

Enzyme Commission numbers have corresponding names that describe the functions of enzymes in such a way that EC x is a more general description than EC x.y that in turn is a more general description than EC x.y.z. The top level EC numbers and names are listed below:

EC 1 oxidoreductases

EC 2 transferases

EC 3 hydrolases

EC 4 lyases

EC 5 isomerases

EC 6 ligases

The EC name for a given EC number can be viewed at http://www.chem.qmul.ac.uk/iupac/jcbn/index.html#6

Mappings between probe identifiers and enzyme identifiers were obtained using files provided by: KEGG GENOME ftp://ftp.genome.jp/pub/kegg/genomes With a date stamp from the source of: 2011-Mar15

References

ftp://ftp.genome.ad.jp/pub/kegg/pathways

hgu95aGENENAME 9

Examples

```
x <- hgu95aENZYME
# Get the probe identifiers that are mapped to an EC number
mapped probes <- mappedkeys(x)
# Convert to a list
xx <- as.list(x[mapped probes])
if(length(xx) > 0) {
 \# Get the ENZYME for the first five probes
 xx[1:5]
 \# Get the first one
 xx[[1]]
}
\# Now convert hgu95aENZYME2PROBE to a list to see inside
xx <- as.list(hgu95aENZYME2PROBE)
if(length(xx) > 0)
  \# Get the probe identifiers for the first five enzyme
  \#commission numbers
  xx[1:5]
  \# Get the first one
  xx[[1]]
}
```

hgu95aGENENAME

Map between Manufacturer IDs and Genes

Description

hgu95aGENENAME is an R object that maps manufacturer identifiers to the corresponding gene name.

Details

Each manufacturer identifier maps to a named vector containing the gene name. The vector name corresponds to the manufacturer identifier. If the gene name is unknown, the vector will contain an NA

Gene names currently include both the official (validated by a nomenclature committee) and preferred names (interim selected for display) for genes. Efforts are being made to differentiate the two by adding a name to the vector.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

```
 \begin{array}{l} x <- \ hgu95aGENENAME \\ \# \ Get \ the \ probe \ identifiers \ that \ are \ mapped \ to \ a \ gene \ name \\ mapped\_probes <- \ mappedkeys(x) \\ \# \ Convert \ to \ a \ list \\ xx <- \ as.list(x[mapped\_probes]) \\ if(length(xx) > 0) \ \{ \\ \# \ Get \ the \ GENENAME \ for \ the \ first \ five \ probes \\ xx[1:5] \end{array}
```

10 hgu95aGO

```
# Get the first one xx[[1]]
```

hgu95aGO

Maps between manufacturer IDs and Gene Ontology (GO) IDs

Description

hgu95aGO is an R object that provides mappings between manufacturer identifiers and the GO identifiers that they are directly associated with. This mapping and its reverse mapping (hgu95aGO2PROBE) do NOT associate the child terms from the GO ontology with the gene. Only the directly evidenced terms are represented here.

hgu95aGO2ALLPROBES is an R object that provides mappings between a given GO identifier and all of the manufacturer identifiers annotated at that GO term OR TO ONE OF IT'S CHILD NODES in the GO ontology. Thus, this mapping is much larger and more inclusive than hgu95aGO2PROBE.

Details

If hgu95aGO is cast as a list, each manufacturer identifier is mapped to a list of lists. The names on the outer list are GO identifiers. Each inner list consists of three named elements: GOID, Ontology, and Evidence.

The GOID element matches the GO identifier named in the outer list and is included for convenience when processing the data using 'lapply'.

The Ontology element indicates which of the three Gene Ontology categories this identifier belongs to. The categories are biological process (BP), cellular component (CC), and molecular function (MF).

The Evidence element contains a code indicating what kind of evidence supports the association of the GO identifier to the manufacturer id. The evidence codes in use include:

IMP: inferred from mutant phenotype IGI: inferred from genetic interaction IPI: inferred from physical interaction ISS: inferred from sequence similarity

IDA: inferred from direct assay

IEP: inferred from expression pattern IEA: inferred from electronic annotation

TAS: traceable author statement NAS: non-traceable author statement ND: no biological data available

IC: inferred by curator

If hgu95aGO2ALLPROBES or hgu95aGO2PROBE is cast as a list, each GO term maps to a named vector of manufacturer identifiers and evidence codes. A GO identifier may be mapped to the same manufacturer identifier more than once but the evidence code can be different. Mappings between Gene Ontology identifiers and Gene Ontology terms and other information are available in a separate data package named GO.

hgu95aGO 11

Whenever any of these mappings are cast as a data.frame, all the results will be output in an appropriate tabular form.

Mappings between manufacturer identifiers and GO information were obtained through their mappings to manufacturer identifiers. NAs are assigned to manufacturer identifiers that can not be mapped to any Gene Ontology information. Mappings between Gene Ontology identifiers an Gene Ontology terms and other information are available in a separate data package named GO.

All mappings were based on data provided by: Gene Ontology ftp://ftp.geneontology.org/pub/go/godatabase/archive/lates/lite/ With a date stamp from the source of: 20120901

hgu95aMAP

hgu95aMAPCOUNTS Number of mapped keys for the maps in package hgu95a.db

Description

hgu95aMAPCOUNTS provides the "map count" (i.e. the count of mapped keys) for each map in package hgu95a.db.

Details

This "map count" information is precalculated and stored in the package annotation DB. This allows some quality control and is used by the checkMAPCOUNTS function defined in AnnotationDbi to compare and validate different methods (like count.mappedkeys(x) or sum(!is.na(as.list(x)))) for getting the "map count" of a given map.

See Also

mappedkeys, count.mappedkeys, checkMAPCOUNTS

Examples

```
\label{eq:hgu95aMAPCOUNTS} $$ mapnames <- names(hgu95aMAPCOUNTS)$ $$ hgu95aMAPCOUNTS[mapnames[1]] $$ x <- get(mapnames[1]) $$ sum(!is.na(as.list(x))) $$ count.mappedkeys(x) $$ \#$ much faster! $$ \#\#$ Check the "map count" of all the maps in package hgu95a.db $$ checkMAPCOUNTS("hgu95a.db")
```

hgu95aMAP

Map between Manufacturer Identifiers and cytogenetic maps/bands

Description

hgu95aMAP is an R object that provides mappings between manufacturer identifiers and cytoband locations.

Details

Each manufacturer identifier is mapped to a vector of cytoband locations. The vector length may be one or longer, if there are multiple reported chromosomal locations for a given gene. An NA is reported for any manufacturer identifiers that cannot be mapped to a cytoband at this time.

Cytogenetic bands for most higher organisms are labeled p1, p2, p3, q1, q2, q3 (p and q are the p and q arms), etc., counting from the centromere out toward the telomeres. At higher resolutions, sub-bands can be seen within the bands. The sub-bands are also numbered from the centromere out toward the telomere. Thus, a label of 7q31.2 indicates that the band is on chromosome 7, q arm, band 3, sub-band 1, and sub-sub-band 2.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

hgu95aOMIM

Map between Manufacturer Identifiers and Mendelian Inheritance in Man (MIM) identifiers

Description

hgu95aOMIM is an R object that provides mappings between manufacturer identifiers and OMIM identifiers.

Details

Each manufacturer identifier is mapped to a vector of OMIM identifiers. The vector length may be one or longer, depending on how many OMIM identifiers the manufacturer identifier maps to. An NA is reported for any manufacturer identifier that cannot be mapped to an OMIM identifier at this time.

OMIM is based upon the book Mendelian Inheritance in Man (V. A. McKusick) and focuses primarily on inherited or heritable genetic diseases. It contains textual information, pictures, and reference information that can be searched using various terms, among which the MIM number is one.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

hgu95aORGANISM

The Organism information for hgu95a

Description

hgu95aORGANISM is an R object that contains a single item: a character string that names the organism for which hgu95a was built. hgu95aORGPKG is an R object that contains a character vector with the name of the organism package that a chip package depends on for its gene-centric annotation.

Details

Although the package name is suggestive of the organism for which it was built, hgu95aORGANISM provides a simple way to programmatically extract the organism name. hgu95aORGPKG provides a simple way to programmatically extract the name of the parent organism package. The parent organism package is a strict dependency for chip packages as this is where the gene cetric information is ultimately extracted from. The full package name will always be this string plus the extension ".db". But most programatic access will not require this extension, so its more convenient to leave it out.

Examples

 ${\bf hgu95aORGANISM} \\ {\bf hgu95aORGPKG}$

hgu95aPATH

Mappings between probe identifiers and KEGG pathway identifiers

Description

KEGG (Kyoto Encyclopedia of Genes and Genomes) maintains pathway data for various organisms.

hgu95aPATH maps probe identifiers to the identifiers used by KEGG for pathways in which the genes represented by the probe identifiers are involved

hgu95aPATH2PROBE is an R object that provides mappings between KEGG identifiers and manufacturer identifiers.

Details

Each KEGG pathway has a name and identifier. Pathway name for a given pathway identifier can be obtained using the KEGG data package that can either be built using AnnBuilder or downloaded from Bioconductor http://www.bioconductor.org.

Graphic presentations of pathways are searchable at url http://www.genome.ad.jp/kegg/pathway.html by using pathway identifiers as keys.

Mappings were based on data provided by: KEGG GENOME ftp://ftp.genome.jp/pub/kegg/genomes With a date stamp from the source of: 2011-Mar15

```

hgu95aPFAM

Map Manufacturer IDs to Pfam IDs

Description

hgu95aPFAM is an R object that provides mappings between a manufacturer identifier and the associated Pfam identifiers.

Details

Each manufacturer identifier maps to a named vector of Pfam identifiers. The name for each Pfam identifier is the IPI accession numbe where this Pfam identifier is found.

If the Pfam is a named NA, it means that the associated Entrez Gene id of this manufacturer identifier is found in an IPI entry of the IPI database, but there is no Pfam identifier in the entry.

If the Pfam is a non-named NA, it means that the associated Entrez Gene id of this manufacturer identifier is not found in any IPI entry of the IPI database.

Mappings were based on data provided by: Uniprot http://www.uniprot.org/ With a date stamp from the source of: Thu Sep 6 14:10:54 2012

```
x <- hgu95aPFAM # Get the probe identifiers that are mapped to any Pfam ID mapped_probes <- mappedkeys(x) # Convert to a list xx <- as.list(x[mapped_probes])
```

16 hgu95aPMID

```
# randomly display 10 probes sample(xx, 10)
```

hgu95aPMID

Maps between Manufacturer Identifiers and PubMed Identifiers

Description

hgu95aPMID is an R object that provides mappings between manufacturer identifiers and PubMed identifiers. hgu95aPMID2PROBE is an R object that provides mappings between PubMed identifiers and manufacturer identifiers.

Details

When hgu95aPMID is viewed as a list each manufacturer identifier is mapped to a named vector of PubMed identifiers. The name associated with each vector corresponds to the manufacturer identifier. The length of the vector may be one or greater, depending on how many PubMed identifiers a given manufacturer identifier is mapped to. An NA is reported for any manufacturer identifier that cannot be mapped to a PubMed identifier.

When hgu95aPMID2PROBE is viewed as a list each PubMed identifier is mapped to a named vector of manufacturer identifiers. The name represents the PubMed identifier and the vector contains all manufacturer identifiers that are represented by that PubMed identifier. The length of the vector may be one or longer, depending on how many manufacturer identifiers are mapped to a given PubMed identifier.

Titles, abstracts, and possibly full texts of articles can be obtained from PubMed by providing a valid PubMed identifier. The pubmed function of annotate can also be used for the same purpose.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

hgu95aPROSITE

Map Manufacturer IDs to PROSITE ID

Description

hgu95aPROSITE is an R object that provides mappings between a manufacturer identifier and the associated PROSITE identifiers.

Details

Each manufacturer identifier maps to a named vector of PROSITE identifiers. The name for each PROSITE identifier is the IPI accession numbe where this PROSITE identifier is found.

If the PROSITE is a named NA, it means that the associated Entrez Gene id of this manufacturer identifier is found in an IPI entry of the IPI database, but there is no PROSITE identifier in the entry.

If the PROSITE is a non-named NA, it means that the associated Entrez Gene id of this manufacturer identifier is not found in any IPI entry of the IPI database.

Mappings were based on data provided by: Uniprot http://www.uniprot.org/ With a date stamp from the source of: Thu Sep 6 14:10:54 2012

```
x <- hgu95aPROSITE

# Get the probe identifiers that are mapped to any PROSITE ID

mapped_probes <- mappedkeys(x)

# Convert to a list

xxx <- as.list(x[mapped_probes])

# randomly display 10 probes

xxx[sample(1:length(xxx), 10)]
```

18 hgu95aREFSEQ

hgu95aREFSEQ

Map between Manufacturer Identifiers and RefSeq Identifiers

Description

hgu95aREFSEQ is an R object that provides mappings between manufacturer identifiers and Ref-Seq identifiers.

Details

Each manufacturer identifier is mapped to a named vector of RefSeq identifiers. The name represents the manufacturer identifier and the vector contains all RefSeq identifiers that can be mapped to that manufacturer identifier. The length of the vector may be one or greater, depending on how many RefSeq identifiers a given manufacturer identifier can be mapped to. An NA is reported for any manufacturer identifier that cannot be mapped to a RefSeq identifier at this time.

RefSeq identifiers differ in format according to the type of record the identifiers are for as shown below:

NG_XXXXX: RefSeq accessions for genomic region (nucleotide) records

NM_XXXXX: RefSeq accessions for mRNA records

NC_XXXXX: RefSeq accessions for chromosome records

NP_XXXXX: RefSeq accessions for protein records

XR_XXXXX: RefSeq accessions for model RNAs that are not associated with protein products

XM_XXXXX: RefSeq accessions for model mRNA records

XP_XXXXX: RefSeq accessions for model protein records

Where XXXXX is a sequence of integers.

NCBI http://www.ncbi.nlm.nih.gov/RefSeq/ allows users to query the RefSeq database using RefSeq identifiers.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

References

http://www.ncbi.nlm.nih.gov/RefSeq/

```
 \begin{array}{l} x <- \ hgu95aREFSEQ \\ \# \ Get \ the \ probe \ identifiers \ that \ are \ mapped \ to \ any \ RefSeq \ ID \\ mapped\_probes <- \ mappedkeys(x) \\ \# \ Convert \ to \ a \ list \\ xx <- \ as.list(x[mapped\_probes]) \\ if(length(xx) > 0) \ \{ \\ \# \ Get \ the \ REFSEQ \ for \ the \ first \ five \ probes \\ xx[1:5] \\ \# \ Get \ the \ first \ one \\ xx[[1]] \\ \} \end{array}
```

hgu95aSYMBOL 19

 ${\rm hgu}95 {\rm aSYMBOL}$

Map between Manufacturer Identifiers and Gene Symbols

Description

hgu95aSYMBOL is an R object that provides mappings between manufacturer identifiers and gene abbreviations.

Details

Each manufacturer identifier is mapped to an abbreviation for the corresponding gene. An NA is reported if there is no known abbreviation for a given gene.

Symbols typically consist of 3 letters that define either a single gene (ABC) or multiple genes (ABC1, ABC2, ABC3). Gene symbols can be used as key words to query public databases such as Entrez Gene.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

References

http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?db=gene

Examples

```
x <- hgu95aSYMBOL 

# Get the probe identifiers that are mapped to a gene symbol mapped_probes <- mappedkeys(x) 

# Convert to a list 

xx <- as.list(x[mapped_probes]) 

if(length(xx) > 0) { 

# Get the SYMBOL for the first five probes 

xx[1:5] 

# Get the first one 

xx[[1]] }
```

hgu95aUNIGENE

Map between Manufacturer Identifiers and UniGene cluster identifiers

Description

hgu95aUNIGENE is an R object that provides mappings between manufacturer identifiers and Uni-Gene identifiers. 20 hgu95aUNIPROT

Details

Each manufacturer identifier is mapped to a UniGene identifier. An NA is reported if the manufacturer identifier cannot be mapped to UniGene at this time.

A UniGene identifier represents a cluster of sequences of a gene. Using UniGene identifiers one can query the UniGene database for information about the sequences or the Entrez Gene database for information about the genes.

Mappings were based on data provided by: Entrez Gene ftp://ftp.ncbi.nlm.nih.gov/gene/DATA With a date stamp from the source of: 2012-Sep4

References

http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?db=gene

Examples

```
x <- hgu95aUNIGENE \# Get the probe identifiers that are mapped to an UNIGENE ID mapped_probes <- mappedkeys(x) \# Convert to a list xx <- as.list(x[mapped_probes]) if(length(xx) > 0) { \# Get the UNIGENE for the first five probes xx[1:5] \# Get the first one xx[[1]] }
```

hgu95aUNIPROT

Map Uniprot accession numbers with Entrez Gene identifiers

Description

hgu95aUNIPROT is an R object that contains mappings between the manufacturer identifiers and Uniprot accession numbers.

Details

This object is a simple mapping of manufacturer identifiers to Uniprot Accessions.

Mappings were based on data provided by NCBI (link above) with an exception for fly, which required retrieving the data from ensembl http://www.ensembl.org/biomart/martview/

```
x <- hgu95aUNIPROT \# Get the entrez gene IDs that are mapped to an Uniprot ID mapped_genes <- mappedkeys(x) \# Convert to a list xx <- as.list(x[mapped_genes]) if(length(xx) > 0) { \# Get the Uniprot IDs for the first five genes xx[1:5] \# Get the first one
```

hgu95aUNIPROT 21

```
xx[[1]]
}
```
